Rapid Pile Repair Kit

Compatible with Current Military Engineering Capabilities

Description
PileMedic® is a high-strength Fiber Reinforced Polymer laminate constructed with bidirectional glass fabrics providing strength in both longitudinal and transverse directions. The laminate is wrapped around the column or pile and the overlapping portions are bonded together using QuakeBond 220UR (Underwater Resin). The annular space between the laminate and the host pile is filled with a non-shrink grout.

Advantages
One Size Fits All – A roll of laminate can be cut in the field to fit any shape or size pile.
Axial and Flexural Strength – PileMedic® laminates are reinforcing sheets, like steel plates. They have the equivalent strength of a #4 rebar spaced every 2.5 inches.
Confinement Pressure—No bolted or glued seams that become the weak point under loading.
Long Lifespan—Made of composite materials that will not corrode.
Ease of Installation – Minimal training and equipment needed for rapid installations.
Full Restoration of Pile Capacity – Full capacity is reached within 24 hours.
**RAPID PILE REPAIR KIT**

**PileMedic**

Compatible with Current Military Engineering Capabilities

A five man crew can repair 40 Linear Feet of pile in 8 hours! - Independent Assessor

1) Clean Pile—use water blasting or scraper
2) Install Spacers and Skirt on Pile—type and number explained in kit manual
3) Measure, Cut & Coat Jacket—jacket gets a thin layer of epoxy
4) Wrap and Strap Jacket in Place—zip ties hold jacket while epoxy cures
5) Fill Annular Space—set grout plug and fill the inside of jacket.

---

**Pile Repair Kit -
58" X 42" X 45" and 1700lbs**

One kit repairs 200 linear feet of pile (based off a 25 inch diameter pile, grout not included)

- PileMedic® Laminates - 3000sqft
- Epoxy & Static Mixers - 130 cartridges
- Underwater Grout Additive - good for 1yd³ of grout
- Foam & Skirts
- PileMedic Spacers - 1275 pcs
- Zip Ties, Nitrile Gloves & Putty
- Knives

---

**Tool Kit -**

- Electric drills
- Heavy Duty Shrink Wrap
- 1/2" drill bit kit
- Pneumatic carrot gun
- Manual Cartridge gun
- Pneumatic drills
- Pneumatic Oil
- Magnetic drill bits
- Zip Tie Tensioner
- Measuring tape
- Mixing paddle
- Measuring Cups
- Mechanic Gloves
- Measuring Cups
- Nylon rope
- Gloves
- Shears
- String

**Corner Spacer**
Used on the corners of the column.

**Starter Spacer**
Used for hooping jacket at the start of wrapping.

**Skirt Pin**
Used to pinch plastic skirt against pile and support the jacket.

**Slot 1**
Skirt pins with zip tie in slot 1 go on the corners of the column.

**Slot 2**
Skirt pins with zip tie in slot 2 go on the center faces of the column.

PileMedic® Jacket
Quick Reference Guide for Circular Piles

Pile
The cut length is determined by pile dimensions. Refer to the cheat sheet for jacket cut length.

PileMedic® Jacket

Epoxy
Epoxy is only applied on the second half of the jacket.

Punched Starter Hole
Punch a hole 1" from the side and 6" from the top of the jacket.

String
Tie string and hook to starter spacer on top zip tie assembly.

The jacket is wrapped twice around the pile with the epoxy side facing inwards.

Top Zip Tie
This assembly is comprised of a zip tie, a starter spacer and omega spacers. It is to be tied 6" under the top of the jacket. Refer to the cheat sheet to determine the correct number of spacers.

Bottom Zip Tie
A zip tie, a starter spacer and omega spacers comprise this assembly. It is to be tied 6" over the Base Zip Tie. The number of omega's can be found in the cheat sheet on the back of this page.

Base Zip Tie
A zip tie, and skirt pins comprise this assembly. The number of skirt pins can be found in the cheat sheet, on the back of this page.

Skirt
Held in place by Base Zip Tie assembly. The skirt holds the grout that fills the annular space between the column and jacket.

Installing Base, Top, and Bottom Zip Tie Assemblies

The appropriate type and number of spacers can be found in your PileMedic® Installers Cheat Sheet.

Please ensure you are wearing appropriate safety gear during this installation.

1) Measure, Cut and Wrap skirt around the pile followed by the base zip tie assembly (Figure 3). The base zip tie assembly serves to pinch the skirt as tightly against the pile as possible. Shift the skirt pins around the pile to their appropriate positions, and let skirt hang down around the base spacers (Figure 4). For square columns, make sure the Skirt pins with Slot 2 go on the center of the column, and Skirt pins with Slot 1 go on the corners of the column (Figure 5).

![Figure 3](image1.png)  ![Figure 4](image2.png)  ![Figure 5](image3.png)

2) The top zip tie assembly begins with a starter spacer (Figure 6). This starter spacer is the anchor point for the jacket as you wrap the jacket around the pile. (Refer to Installer’s Cheat Sheet for the number and type of spacers required).

![Figure 6](image4.png)

3) Assemble the bottom zip tie assembly (Figures 7 and 8). (Refer to Installer’s Cheat Sheet for the number and type of spacers required).

![Figure 7. Bottom zip tie assembly for round piles.](image5.png)  ![Figure 8. Bottom zip tie assembly for square columns.](image6.png)
Installation of the PileMedic® Jacket

1) Measure, Mark and Cut the Jacket (Figure 9) Please refer to the PileMedic® Installers Cheat Sheet to determine the length of jacket and what materials will be needed for your specific pile size.

*If your pile size is not located on the cheat sheet, use the following calculation to determine the jacket length:
Circular Piles: [Pile Diameter(in)+3]*3.14*2+8 = jacket length (in)
Square Piles: [Pile Width(in)*1.41+1]*3.14*2+8 = jacket length (in)

2) Punch a small hole in the top corner of the jacket, and tie a loop through the hole (Figure 10). This loop will be used to anchor the top corner of the jacket to the pile.

3) Unscrew the cap of the QuakeBond® cartridge and screw the static mixer nozzle onto the cartridge. Load the cartridge into the manual or pneumatic dispenser. Dispense mixed epoxy on only HALF the jacket, and be sure it is on the jacket half that is opposite of the hole that was punched earlier. Spread mixed epoxy with a putty knife (Figure 11). The coat of epoxy should be about as thick as a credit card (or approximately 30 mils).

Attach the PileMedic Gripper to the end of the jacket allowing the installer to get a tight grip on the jacket while it is wrapped around the pile (Figure 12).
4) Secure the string into the starter spacer, then wrap the jacket around the pile allowing the epoxy to stick to the inside layer of the jacket (*Figure 13*).

*Figure 13*

5) Wrap a few zip ties around the jacket to hold it in place during cure. Shove pieces of foam between the jacket and pile to fill the bottom of the annular space (*Figure 14*).

*Figure 14*

6) Lift the skirt up along the jacket and tightly secure with a zip tie (*Figure 15*).

*Figure 15*
Installing Multiple Jacket Heights

1) Cut nylon rope to twice the length of the pile repair height. Attach one end of the nylon rope to the top of the pile via a screw (timber pile) or zip tie (concrete pile). Attach a vise grip to the other end of the rope and let it hang down along the pile.

2) Wrap the first jacket around the pile and rope. Retrieve the rope and use it to hold the first jacket from sliding down the pile until the second jacket gets attached with a screw to the first jacket (Figure 16).

3) Apply additional epoxy along the length of the jacket that will be overlapped to the first jacket.

4) Screw the bottom corner of the second jacket to the first jacket and wrap the jacket around the pile. Make sure the jackets overlap around 4” vertically.

5) Wrap a zip tie around the overlapped seam between the two jackets.

6) Lower the rope and jackets and attach additional jackets as needed.

7) Remove rope from pile before filling with grout.

- It is highly recommended to install multiple height jackets and pour a small grout plug on the first day. Then on the following day fill the remaining portion of the jackets with grout. This will allow the grout and epoxy to cure and prevent leakage during pour.

Installing the Grout

Mix a Non-Shrink grout and pour it into the space between the pile and the PileMedic® jacket. Be sure to mix the grout according to manufacturer’s recommendations. For applications below water level, you will need to use the tremie grout placement method.

For tremie grouting, place the end of the grout hose on the inside of the jacket, making sure it runs all the way to the bottom. Pump the grout until the inside level of grout is approximately six inches above the hose nozzle (Figure 17). Continue pumping while lifting the nozzle of the hose at the same rate, until the entire annular space between the pile and the jacket is filled. The water inside the jacket will turn grey during this process, so make sure you feel for sand when the grout level reaches the top of the annular space to make sure it is completely filled with grout.
Installation Troubleshooting

**Grout is leaking from seams of jacket**
Wrap shrink wrap tightly around the seam between the two jackets.

**Grout is leaking from the base of the pile when being poured**
The foam and skirt were not installed correctly. If it is a slow leak, wait for grout to set up and form a plug (grout shoe) before continuing to fill the rest of the annular space of the pile. If the leak is fast, insert additional foam into the bottom of the pile, and add a small amount of grout inside the pile till the grout sets up forming a plug.

**Top jacket is sliding down over bottom jacket**
The top jacket wasn’t wrapped as tightly as the bottom jacket. Drill a few screws into the jackets where they should overlap and this will prevent them from sliding over each other.

**Seam of jacket lifted slightly after installation**
Lightly sand area underneath the lifted seam and apply a bead of epoxy underneath the seam. Place a paint stick or thin board on the seam and tighten with zip ties (*Figure 18*). This will tightly push the seam against the jacket until the epoxy cures.

Unique Installation Situations

**Pile has total section loss over a large height**
Attach spacer assemblies to the solid sections of the pile above and below the section loss. Wrap the pile at the top location and tighten with zip ties. Slide the jacket down the pile about four feet. Wrap the next section of jacket around the top of the pile, and screw the two jackets together where they overlap and continue to slide the jackets down the pile. Repeat until the jackets reach the bottom zip tie assembly. A diver will be needed to slide the jackets over the bottom zip tie assembly and position correctly.

**Cross bracing is attached to pile**
Remove cross bracing and reattach to pile after installation has been completed.

**Pile is butted up against another pile or wall**
Slide jacket through the tight space, and continue to pull jacket through the space while tucking it around and into the tight space again. Twist wrapped jacket around pile until fully wrapped (*Figure 19*).
